#### Abstract

A simple graph $G$ admits an $H$-covering if every edge in $E(G)$ belongs to a subgraph of $G$ isomorphic to $H$. The graph $G$ is said to be $H$-magic if there exists a bijection $f: V(G) \cup E(G) \rightarrow\{1,2,3, \cdots,|V(G) \cup E(G)|\}$ such that for every subgraph $H^{\prime}$ of $G$ isomorphic to $H, \sum_{v \in V\left(H^{\prime}\right)} f(v)+\sum_{e \in E\left(H^{\prime}\right)} f(e)$ is constant. Additionally, $G$ is said to be $H$-supermagic if $f(V(G))=$ $\{1,2,3, \cdots,|V(G)|\}$. In this paper, we study $H$-supermagic labelings of two classes of connected graph namely fans and ladders.

AMS 2000 Mathematics Subject Classification. 05C78.
Key words and phrases. Covering, cycle, fan, $H$-supermagic labeling, ladder.

## §1. Introduction

We consider finite, undirected and simple graphs. The vertex and edge sets of a graph $G$ are denoted by $V(G)$ and $E(G)$, respectively. Let $H$ be a graph. An edge-covering of $G$ is a family of subgraphs $H_{1}, \ldots, H_{k}$ such that each edge of $E(G)$ belongs to at least one of the subgraphs $H_{i}, 1 \leq i \leq k$. If every $H_{i}$ is isomorphic to a given graph $H$ then we say that $G$ admits an $H$-covering. Suppose $G$ admits an $H$-covering. A total labeling $f: V(G) \cup E(G) \rightarrow$ $\{1,2,3, \ldots,|V(G) \cup E(G)|\}$ is said an $H$-magic labeling of $G$ if for every subgraph $H^{\prime}$ of $G$ isomorphic to $H, \sum_{v \in V\left(H^{\prime}\right)} f(v)+\sum_{e \in E\left(H^{\prime}\right)} f(e)$ is constant. An $H$-magic labeling $f$ is said an $H$-supermagic labeling if $f(V(G))=$ $\{1,2,3, \ldots,|V(G)|\}$. A graph that admits $H$-(super)magic labeling is called $H$-(super)magic. The sum of all vertex labels and all edge labels on $H$ (under a labeling $f$ ) is denoted by $\sum f(H)$. In Figure 1, we show $C_{4}$-magic and $C_{4}$-supermagic labelings of $L_{4}$.

The $H$-supermagic labeling was first introduced by Gutiérrez and Lladó [5] in 2005. They considered star-supermagic and path-supermagic labelings of some graphs. In [8], Lladó and Moragas gave $C_{n}$-supermagic labelings of

Figure 1: (a). a $C_{4}$-magic labeling of $L_{4} \quad$ (b). a $C_{4}$-supermagic labeling of $L_{4}$
wheels, windmills, prisms and theta graphs. Cycles-supermagic labeling of chain graphs $k C_{n}$-snake, triangle ladders $T L_{n}$, grids $P_{m} \times P_{n}$, for $n=2,3,4,5$, and books $B_{n}$ can be found in [13]. Maryati et al. [9] proved that some classes of trees such as subdivision of stars, shrubs, and banana tree graphs are $P_{h^{-}}$ supermagic for some $h$ and prove that certain shackles and amalgamations of a connected graph $H$ are $H$-supermagic [10].

For $H \cong P_{2}$, an $H$-supermagic graph is also called a super edge-magic graph. The notion of a super edge-magic graph was introduced by Enomoto at al. [2] as a particular type of edge-magic graph given by Kotzig and Rosa [6]. There are many graphs that have been proved to be (super) edge-magic graphs, see for instance $[3,11,12,14,15]$. For further information about (super) edge-magic graphs, see [4]. The $H$-magic labeling is related to a face-magic labeling of a plane graph introduced by Lih [7]. A total labeling $f$ of a plane graph is said to be face-magic if for every positive integer $s$, all $s$-sided faces have the same weight. The weight of a face under a labeling $f$ is the sum of labels carried by the edges and vertices surrounding it. Lih [7] allows different weights for different $s$. If a plane graph $G$ contains only $n$-sided faces, then face-magic labeling of $G$ is also $C_{n}$-magic labeling. Other results about this labeling can be found in [1].

In this paper, we study $C_{m}$ and $F_{m}$-supermagic labelings of fans $F_{n}$, and $C_{m}$ and $L_{m}$-supermagic labelings of ladders $L_{n}$ for all possible values of $m$ and $n$.

## §2. Supermagic coverings of fans

In this section we consider $C_{m}$ and $F_{m}$-supermagic labelings of the fans $F_{n}$. We define the fans $F_{n} \cong P_{n}+\{c\}$ as a graph with

$$
V\left(F_{n}\right)=\left\{c, x_{i} \mid i=1,2,3, \ldots, n\right\}
$$

and

$$
E\left(F_{n}\right)=\left\{c x_{i} \mid i=1,2,3, \ldots, n\right\} \cup\left\{x_{i} x_{i+1} \mid i=1,2,3, \ldots, n-1\right\} .
$$

In [7], Lih proved that $F_{n}$ is $C_{3}$-supermagic for every $n$ except $n \equiv 2(\bmod 4)$. Furthermore, Ngurah et al. [13] proved that $F_{n}$ is $C_{3}$-supermagic for any $n \geq 2$. In the following theorem, we show that $F_{n}$ is $C_{m}$-supermagic for any integer $4 \leq m \leq\left\lfloor\frac{n+4}{2}\right\rfloor$.

Theorem 1. Let $n \geq 4$ be a positive integer. Then the fan $F_{n}$ is $C_{m}$ supermagic for any integer $4 \leq m \leq\left\lfloor\frac{n+4}{2}\right\rfloor$.

Proof. First, label every vertex in the following way.

- Label the vertex $c$ with 1 .

Case 1: $n \equiv 0(\bmod m-1)$

- Label $x_{1}, x_{m}, x_{2 m-1}, x_{3 m-2}, x_{4 m-3}, \ldots, x_{n-m+2}$ with $2,3,4,5,6, \ldots$, $\frac{n}{m-1}+1$, respectively.
- For $1 \leq k \leq m-2$, label $x_{1+k}, x_{m+k}, x_{2 m+k-1}, x_{3 m+k-2}, x_{4 m+k-3}$, $\ldots, x_{n-m+k+2}$ with $k\left(\frac{n}{m-1}\right)+2, k\left(\frac{n}{m-1}\right)+3, k\left(\frac{n}{m-1}\right)+4, k\left(\frac{n}{m-1}\right)+5$, $k\left(\frac{n}{m-1}\right)+6, \ldots,(k+1)\left(\frac{n}{m-1}\right)+1$, respectively.

Case 2: $n \equiv 1(\bmod m-1)$

- Label $x_{1}, x_{m}, x_{2 m-1}, x_{3 m-2}, x_{4 m-3}, \ldots, x_{n-m+1}, x_{n}$ with $2,3,4,5,6$, $\ldots, \frac{n-1}{m-1}+1, \frac{n-1}{m-1}+2$, respectively.
- For $1 \leq k \leq m-2$, label $x_{1+k}, x_{m+k}, x_{2 m+k-1}, x_{3 m+k-2}, x_{4 m+k-3}$, $\ldots, x_{n-m+k+1}$ with $k\left(\frac{n-1}{m-1}\right)+3, k\left(\frac{n-1}{m-1}\right)+4, k\left(\frac{n-1}{m-1}\right)+5, k\left(\frac{n-1}{m-1}\right)+6$, $k\left(\frac{n-1}{m-1}\right)+7, \ldots,(k+1)\left(\frac{n-1}{m-1}\right)+2$, respectively.

Case 3: $n \equiv t(\bmod m-1)$, where $t=2,3,4, \ldots, m-2$

- Label $x_{1}, x_{m}, x_{2 m-1}, x_{3 m-2}, x_{4 m-3}, \ldots, x_{n-m-t+2}, x_{n-t+1}$ with 2,3 , $4,5,6, \ldots, \frac{n-t}{m-1}+1, \frac{n-t}{m-1}+2$, respectively.
- Label $x_{n-t+2}, x_{n-t+3}, x_{n-t+4}, \ldots, x_{n}$ with $2\left(\frac{n-t}{m-1}\right)+3,3\left(\frac{n-t}{m-1}\right)+4$, $4\left(\frac{n-t}{m-1}\right)+5, \ldots, t\left(\frac{n-t}{m-1}\right)+t+1$, respectively.
- For $1 \leq k \leq t$, label $x_{1+k}, x_{m+k}, x_{2 m+k-1}, x_{3 m+k-2}, x_{4 m+k-3}, \ldots$, $x_{n-m-t+k+2}$ with $\gamma_{1}^{k}+2, \gamma_{1}^{k}+3, \gamma_{1}^{k}+4, \gamma_{1}^{k}+5, \gamma_{1}^{k}+6, \ldots, \gamma_{1}^{k}+\left(\frac{n-t}{m-1}+1\right)$, respectively, where $\gamma_{1}^{k}=k\left(\frac{n-t}{m-1}+1\right)$.
- For $t+1 \leq k \leq m-2$, label $x_{1+k}, x_{m+k}, x_{2 m+k-1}, x_{3 m+k-2}, x_{4 m+k-3}, \ldots$, $x_{n-m-t+k+2}$ with $\gamma_{2}^{k}+2, \gamma_{2}^{k}+3, \gamma_{2}^{k}+4, \gamma_{2}^{k}+5, \gamma_{2}^{k}+6, \ldots, \gamma_{2}^{k}+\left(\frac{n-t}{m-1}\right)+1$, respectively, where $\gamma_{2}^{k}=k\left(\frac{n-t}{m-1}\right)+t$.

Next, label every edge as follows.

- For $1 \leq i \leq n$, label $c x_{i}$ with $3 n+1-i$.

For labeling the remaining edges, let $e_{i}=x_{i} x_{i+1}, 1 \leq i \leq n-1$, and let $q=n-1$.

Case 1: $q \equiv 0(\bmod m-2)$

- Label $e_{1}, e_{m-1}, e_{2 m-3}, e_{3 m-5}, e_{4 m-7}, \ldots, e_{q-m+3}$ with $n+2, n+3, n+4$, $n+5, n+6, \ldots, n+\frac{q}{m-2}+1$, respectively.
- For $1 \leq k \leq m-3$, label $e_{1+k}, e_{m-1+k}, e_{2 m-3+k}, e_{3 m-5+k}, e_{4 m-7+k}, \ldots$, $e_{q-m+3+k}$ with $\gamma_{3}^{k}+2, \gamma_{3}^{k}+3, \gamma_{3}^{k}+4, \gamma_{3}^{k}+5, \gamma_{3}^{k}+6, \ldots, \gamma_{3}^{k}+\left(\frac{q}{m-2}\right)+1$, respectively, where $\gamma_{3}^{k}=k\left(\frac{q}{m-2}\right)+n$.

Case 2: $q \equiv 1(\bmod m-2)$

- Label $e_{1}, e_{m-1}, e_{2 m-3}, e_{3 m-5}, e_{4 m-7}, \ldots, e_{q}$ with $n+2, n+3, n+4$, $n+5, n+6, \ldots, n+\frac{q-1}{m-2}+2$, respectively.
- For $1 \leq k \leq m-3$, label $e_{1+k}, e_{m-1+k}, e_{2 m-3+k}, e_{3 m-5+k}, e_{4 m-7+k}, \ldots$, $e_{q-m+2+k}$ with $\gamma_{4}^{k}+3, \gamma_{4}^{k}+4, \gamma_{4}^{k}+5, \gamma_{4}^{k}+6, \gamma_{4}^{k}+7, \ldots, \gamma_{4}^{k}+\left(\frac{q-1}{m-2}\right)+2$, respectively, where $\gamma_{4}^{k}=k\left(\frac{q-1}{m-2}\right)+n$.

Case 3: $q \equiv t(\bmod m-2)$, where $t=2,3,4, \ldots, m-3$

- Label $e_{1}, e_{m-1}, e_{2 m-3}, e_{3 m-5}, e_{4 m-7}, \ldots, e_{q-t+1}$ with $n+2, n+3, n+4$, $n+5, n+6, \ldots, n+\frac{q-t}{m-2}+2$, respectively.
- Label $e_{q-t+2}, e_{q-t+2}, e_{q-t+3}, \ldots, e_{q}$ with $n+2\left(\frac{q-t}{m-2}\right)+3, n+3\left(\frac{q-t}{m-2}\right)+4$, $n+4\left(\frac{q-t}{m-2}\right)+5, \ldots, n+t\left(\frac{q-t}{m-2}\right)+t+1$, respectively.
- For $1 \leq k \leq t$, label $e_{1+k}, e_{m-1+k}, e_{2 m-3+k}, e_{3 m-5+k}, e_{4 m-7+k}, \ldots$, $e_{q-t-m+3+k}$ with $\gamma_{5}^{k}+2, \gamma_{5}^{k}+3, \gamma_{5}^{k}+4, \gamma_{5}^{k}+5, \gamma_{5}^{k}+6, \ldots, \gamma_{5}^{k}+\frac{q-t}{m-2}+1$, respectively, $\gamma_{5}^{k}=k\left(\frac{q-t}{m-2}+1\right)+n$.
- For $t+1 \leq k \leq m-3$, label $e_{1+k}, e_{m-1+k}, e_{2 m-3+k}, e_{3 m-5+k}, e_{4 m-7+k}$, $\ldots, e_{q-t-m+3+k}$ with $\gamma_{6}^{k}+2, \gamma_{6}^{k}+3, \gamma_{6}^{k}+4, \gamma_{6}^{k}+5, \gamma_{6}^{k}+6, \ldots, \gamma_{6}^{k}+\frac{q-t}{m-2}+1$, respectively, $\gamma_{6}^{k}=k\left(\frac{q-t}{m-2}\right)+n+t$.

Let us denote the total labeling defined above by $h$. It can be checked that $h\left(V\left(F_{n}\right)\right)=\{1,2,3, \ldots, n+1\}$; for $1 \leq i \leq n-m+1, h\left(x_{i}\right)=h\left(x_{i+m-1}\right)-1$, $h\left(x_{i} x_{i+1}\right)=h\left(x_{i+m-2} x_{i+m-1}\right)-1$, and $h\left(c x_{i}\right)+h\left(c x_{i+m-2}\right)=h\left(c x_{i+1}\right)+$ $h\left(c x_{i+m-1}\right)+2$.

For $1 \leq i \leq n-m+2$, let $C_{m}^{(i)}$ be the subcycle of $F_{n}$ with $V\left(C_{m}^{(i)}\right)=$ $\left\{c, x_{j} \mid i \leq j \leq i+m-2\right\}$ and $E\left(C_{m}^{(i)}\right)=\left\{c x_{i}, c x_{i+m-2}\right\} \cup\left\{x_{j} x_{j+1} \mid i \leq j \leq i+\right.$ $m-3\}$. It is easy to verify that for $1 \leq i \leq n-m+1, \sum h\left(C_{m}^{(i)}\right)=\sum h\left(C_{m}^{(i+1)}\right)$. Thus, for $1 \leq i \leq n-m+2, \sum h\left(C_{m}^{(i)}\right)$ is constant. Hence, $F_{n}$ is $C_{m}$-supermagic for any integer $4 \leq m \leq\left\lfloor\frac{n+4}{2}\right\rfloor$.

Next, we consider fan-supermagic labelings of fan. Notice that $F_{n}$ is $C_{3} \cong$ $F_{2}$-supermagic [13] and $F_{n}$ is trivially $F_{n}$-supermagic. In the following theorem, we show that $F_{n}$ is $F_{m}$-supermagic for all remaining possible values of $m$.

Theorem 2. Let $n \geq 4$ be a positive integer. The fan $F_{n}$ is $F_{m}$-supermagic for every integer $3 \leq m \leq n-1$.

Proof. Define a total labeling of $F_{n}$ as follows.

- For $1 \leq i \leq n-1$, label $x_{i} x_{i+1}$ with $n+1+i$.
- For $1 \leq i \leq n$, label $c x_{i}$ with $3 n+1-i$.
- Label the vertex $c$ with 1 .

For the remaining vertices, we consider three following cases.
Case 1: $n \equiv 0(\bmod m)$

- Label $x_{1}, x_{m+1}, x_{2 m+1}, x_{3 m+1}, \ldots, x_{n-m+1}$ with $2,3,4,5, \ldots, \frac{n}{m}+1$, respectively.
- For $1 \leq k \leq m-1$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots$, $x_{n-m+1+k}$ with $k\left(\frac{n}{m}\right)+2, k\left(\frac{n}{m}\right)+3, k\left(\frac{n}{m}\right)+4, k\left(\frac{n}{m}\right)+5, \ldots,(k+1)\left(\frac{n}{m}\right)+1$, respectively.

Case 2: $n \equiv 1(\bmod m)$

- Label $x_{1}, x_{m+1}, x_{2 m+1}, x_{3 m+1}, \ldots, x_{n-m}, x_{n}$ with $2,3,4,5, \ldots, \frac{n-1}{m}+1$, $\frac{n-1}{m}+2$, respectively.
- For $1 \leq k \leq m-1$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots, x_{n-m+k}$ with $k\left(\frac{n-1}{m}\right)+3, k\left(\frac{n-1}{m}\right)+4, k\left(\frac{n-1}{m}\right)+5, k\left(\frac{n-1}{m}\right)+6, \ldots,(k+1)\left(\frac{n-1}{m}\right)+2$, respectively.

Case 3: $n \equiv t(\bmod m)$, where $t=2,3,4, \ldots, m-1$

- Label $x_{1}, x_{m+1}, x_{2 m+1}, x_{3 m+1}, \ldots, x_{n-t+1}$ with $2,3,4,5, \ldots, \frac{n-t}{m}+2$, respectively.
- Label $x_{n-t+2}, x_{n-t+3}, x_{n-t+4}, \ldots, x_{n}$ with $2\left(\frac{n-t}{m}\right)+3,3\left(\frac{n-t}{m}\right)+4$, $4\left(\frac{n-t}{m}\right)+5, \ldots, t\left(\frac{n-t}{m}\right)+t+1$, respectively.
- For $1 \leq k \leq t$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots, x_{n-m-t+1+k}$ with $k\left(\frac{n-t}{m}+1\right)+2, k\left(\frac{n-t}{m}+1\right)+3, k\left(\frac{n-t}{m}+1\right)+4, k\left(\frac{n-t}{m}+1\right)+5, \ldots,(k+$ 1) $\left(\frac{n-t}{m}+1\right)$, respectively.
- For $t+1 \leq k \leq m-1$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots$, $x_{n-m-t+1+k}$ with $k\left(\frac{n-t}{m}\right)+t+2, k\left(\frac{n-t}{m}\right)+t+3, k\left(\frac{n-t}{m}\right)+t+4, k\left(\frac{n-t}{m}\right)+$ $t+5, \ldots,(k+1)\left(\frac{n-t}{m}\right)+t+1$, respectively.
Denote the total labeling defined above by $f$. It can be checked that $f\left(V\left(F_{n}\right)\right)=\{1,2,3, \ldots, n+1\}$; for $1 \leq i \leq n-m+1$,

$$
\begin{gathered}
\sum_{j=i}^{i+m-1} f\left(x_{j}\right)=-1+\sum_{j=i+1}^{i+m} f\left(x_{j}\right), \\
\sum_{j=i}^{i+m-2} f\left(x_{j} x_{j+1}\right)=1-m+\sum_{j=i+1}^{i+m-1} f\left(x_{j} x_{j+1}\right),
\end{gathered}
$$

and

$$
\sum_{j=i}^{i+m-1} f\left(c x_{j}\right)=m+\sum_{j=i+1}^{i+m} f\left(c x_{j}\right) .
$$

For $1 \leq i \leq n-m+1$, let $F_{m}^{(i)}$ be the subfan of $F_{n}$ with $V\left(F_{m}^{(i)}\right)=\left\{c, x_{j} \mid i \leq\right.$ $j \leq i+m-1\}$ and $E\left(F_{m}^{(i)}\right)=\left\{x_{j} x_{j+1} \mid i \leq j \leq i+m-2\right\} \cup\left\{c x_{j} \mid i \leq j \leq\right.$ $i+m-1\}$. It is a routine procedure to verify that for $1 \leq i \leq n-m$, $\sum f\left(F_{m}^{(i)}\right)=\sum f\left(F_{m}^{(i+1)}\right)$. So, $f$ is an $F_{m}$-supermagic labeling of $F_{n}$. Hence, $F_{n}$ is $F_{m}$-supermagic.

In Figure 2, we show a $C_{4}$-supermagic labeling of $F_{8}$ and an $F_{4}$-supermagic labeling of $F_{10}$ as defined in the proof of Theorems 1 and 2, respectively.

## §3. Supermagic coverings of ladders

Let $L_{n} \cong P_{n} \times P_{2}$ denote the ladder of order $2 n$ and size $3 n-2$. Clearly $L_{n}$ admits a cycle covering of some even order. As a direct consequence of Lladó and Moragas's result (see Theorem 7 [8]), $L_{n}$ is $C_{4}$-supermagic for odd $n$. Later, Ngurah et al. [13] solved for the remaining cases. In the next theorem, we show that $L_{n}$ is also $C_{2 m}$-supermagic for the remaining possible values of $m$.

Figure 2: (a). a $C_{4}$-supermagic labeling of $F_{8}$ (b). an $F_{4}$-supermagic labeling of $F_{10}$

Theorem 3. Let $n \geq 4$ be a positive integer. Then the ladder $L_{n}$ is $C_{2 m}$ supermagic for every integer $3 \leq m \leq\left\lfloor\frac{n}{2}\right\rfloor+1$.

Proof. First, let $L_{n}$ be a graph with

$$
V\left(L_{n}\right)=\left\{x_{i}, y_{i} \mid 1 \leq i \leq n\right\}
$$

and

$$
E\left(L_{n}\right)=\left\{x_{i} x_{i+1}, y_{i} y_{i+1} \mid 1 \leq i \leq n-1\right\} \cup\left\{x_{i} y_{i} \mid 1 \leq i \leq n\right\}
$$

Next, label every edge in the following way.

- For $1 \leq i \leq n-1$, label $x_{i} x_{i+1}$ with $2 n+i$.
- For $1 \leq i \leq n-1$, label $y_{i} y_{i+1}$ with $4 n-1-i$.
- For $1 \leq i \leq n$, label $x_{i} y_{i}$ with $5 n-1-i$.

Label every vertex in the following way.
Case 1: $n \equiv 0(\bmod m)$

- Label $x_{1}, x_{m+1}, x_{2 m+1}, x_{3 m+1}, \ldots, x_{n-m+1}$ with $1,2,3,4, \ldots, \frac{n}{m}$, respectively.
- For $1 \leq k \leq m-1$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots, x_{n-m+1+k}$ with $k\left(\frac{n}{m}\right)+1, k\left(\frac{n}{m}\right)+2, k\left(\frac{n}{m}\right)+3, k\left(\frac{n}{m}\right)+4, \ldots,(k+1)\left(\frac{n}{m}\right)$, respectively.

Case 2: $n \equiv 1(\bmod m)$

- Label $x_{1}, x_{m+1}, x_{2 m+1}, x_{3 m+1}, \ldots, x_{n-m}, x_{n}$ with $1,2,3,4, \ldots,\left(\frac{n-1}{m}\right)$, $\left(\frac{n-1}{m}\right)+1$, respectively.
- For $1 \leq k \leq m-1$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots, x_{n-m+k}$ with $k\left(\frac{n-1}{m}\right)+2, k\left(\frac{n-1}{m}\right)+3, k\left(\frac{n-1}{m}\right)+4, k\left(\frac{n-1}{m}\right)+5, \ldots,(k+1)\left(\frac{n-1}{m}\right)+1$, respectively.

Case 3: $n \equiv t(\bmod m)$, where $t=2,3,4, \ldots, m-1$

- Label $x_{1}, x_{m+1}, x_{2 m+1}, x_{3 m+1}, \ldots, x_{n-t+1}$ with $1,2,3,4, \ldots,\left(\frac{n-t}{m}\right)+1$, respectively.
- Label $x_{n-t+2}, x_{n-t+3}, \ldots, x_{n}$ with $2\left(\frac{n-t}{m}+1\right), 3\left(\frac{n-t}{m}+1\right), \ldots, t\left(\frac{n-t}{m}+1\right)$, respectively.
- For $1 \leq k \leq t$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots, x_{n-m-t+1+k}$ with $k\left(\frac{n-t}{m}+1\right)+1, k\left(\frac{n-t}{m}+1\right)+2, k\left(\frac{n-t}{m}+1\right)+3, k\left(\frac{n-t}{m}+1\right)+4, \ldots$, $k\left(\frac{n-t}{m}+1\right)+\frac{n-t}{m}$, respectively.
- For $t+1 \leq k \leq m-1$, label $x_{1+k}, x_{m+1+k}, x_{2 m+1+k}, x_{3 m+1+k}, \ldots$, $x_{n-m-t+1+k}$ with $k\left(\frac{n-t}{m}\right)+t+1, k\left(\frac{n-t}{m}\right)+t+2, k\left(\frac{n-t}{m}\right)+t+3, k\left(\frac{n-t}{m}\right)+t+4$, $\ldots,(k+1)\left(\frac{n-t}{m}\right)+t$, respectively.

Finally, for $1 \leq i \leq n$, label $y_{i}$ with $n+\left(\right.$ the label of $\left.x_{i}\right)$.
Let us denote the total labeling defined above by $f$. It can be checked that $f\left(V\left(L_{n}\right)\right)=\{1,2,3, \ldots, 2 n\}$; for $1 \leq i \leq n-m$,

$$
\begin{array}{rr}
f\left(x_{i}\right)+f\left(y_{i}\right) & =r\left(x_{m+i}\right)+f\left(y_{m+i}\right)-2, \\
f\left(x_{i} y_{i}\right)+f\left(x_{m+i-1} y_{m+i-1}\right) & = \\
f\left(x_{i+1} y_{i+1}\right)+f\left(x_{m+i} y_{m+i}\right)+2 ;
\end{array}
$$

for $1 \leq i \leq n-2$,

$$
f\left(x_{i} x_{i+1}\right)+f\left(y_{i} y_{i+1}\right)=f\left(x_{i+1} x_{i+2}\right)+f\left(y_{i+1} y_{i+2}\right) .
$$

For $1 \leq i \leq n-m+1$, let $C_{2 m}^{(i)}$, be the subcycle of $L_{n}$ with

$$
V\left(C_{2 m}^{(i)}\right)=\left\{x_{j}, y_{j} \mid i \leq j \leq i+m-1\right\}
$$

and

$$
E\left(C_{2 m}^{(i)}\right)=\left\{x_{j} x_{j+1}, y_{j} y_{j+1} \mid i \leq j \leq i+m-2\right\} \cup\left\{x_{i} y_{i}, x_{i+m-1} y_{i+m-1}\right\}
$$

It is easy to verify that $V\left(C_{2 m}^{(i)}\right) \cap V\left(C_{2 m}^{(i+1)}\right)=\left\{x_{j}, y_{j} \mid i+1 \leq j \leq i+m-1\right\}$ and $E\left(C_{2 m}^{(i)}\right) \cap E\left(C_{2 m}^{(i+1)}\right)=\left\{x_{j} x_{j+1}, y_{j} y_{j+1} \mid i+1 \leq j \leq i+m-2\right\}$.

By using these facts, for $1 \leq i \leq n-m$, we obtain

$$
\begin{aligned}
\sum f\left(C_{2 m}^{(i)}\right) & =\sum_{j=i}^{i+m-1}\left[f\left(x_{j}\right)+f\left(y_{j}\right)\right]+\sum_{j=i}^{i+m-2}\left[f\left(x_{j} x_{j+1}\right)+f\left(y_{j} y_{j+1}\right)\right]+ \\
& f\left(x_{i} y_{i}\right)+f\left(x_{i+m-1} y_{i+m-1}\right) \\
& =\sum_{j=i+1}^{i+m}\left[f\left(x_{j}\right)+f\left(y_{j}\right)\right]+\sum_{j=i+1}^{i+m-1}\left[f\left(x_{j} x_{j+1}\right)+f\left(y_{j} y_{j+1}\right)\right]+ \\
& f\left(x_{i+1} y_{i+1}\right)+f\left(x_{i+m} y_{i+m}\right) \\
& =\sum f\left(C_{2 m}^{(i+1)}\right) .
\end{aligned}
$$

So, for $1 \leq i \leq n-m+1, \sum f\left(C_{2 m}^{(i)}\right)$ is constant. Hence, $f$ is a $C_{2 m^{-}}$ supermagic labeling of $L_{n}$.

Figure 3: (a). a $C_{6}$-supermagic labeling of $L_{6}$, (b). a $C_{8}$-supermagic labeling of $L_{6}$

In Figure 3 we show a $C_{6}$-supermagic labeling and a $C_{8}$-supermagic labeling of $L_{6}$ as defined in the proof of Theorem 3 .

Next, we consider a $L_{m}$-supermagic labeling of $L_{n}$. Notice that, $L_{n}$ is $L_{2} \cong C_{4}$-supermagic and $L_{n}$ is trivially $L_{n}$-supermagic. So, in the following theorem, we consider a $L_{m}$-supermagic labeling of $L_{n}$ for any integer $3 \leq m \leq$ $n-1$.

Theorem 4. Let $n \geq 4$ be a positive integer. Then the ladder $L_{n}$ is $L_{m}$ supermagic for every integer $3 \leq m \leq n-1$.

Proof. For proving this theorem, we define the ladder $L_{n}$ as a graph with $V\left(L_{n}\right)=\left\{x_{i}, y_{i} \mid 1 \leq i \leq n\right\}$ and $E\left(L_{n}\right)=\left\{x_{i} x_{i+1}, y_{i} y_{i+1} \mid 1 \leq i \leq n-1\right\} \cup$ $\left\{x_{i} y_{n+1-i} \mid 1 \leq i \leq n\right\}$.

Define a total labeling of $L_{n}$ in the following way.

- For $1 \leq i \leq n$, label $x_{i}$ as in the proof of Theorem 3 .
- For $1 \leq i \leq n$, label $y_{i}$ with $n+$ (the label of $x_{n+1-i}$ ).
- For $1 \leq i \leq n-1$, label $x_{i} x_{i+1}$ with $2 n+i$.
- For $1 \leq i \leq n$, label $x_{i} y_{n+1-i}$ with $5 n-1-i$.

For labeling $y_{i} y_{i+1}$, we consider two following cases. First, let $q=n-2$.
Case 1: $q \equiv 0(\bmod m-1)$

- Label $y_{1} y_{2}, y_{m} y_{m+1}, y_{2 m-1} y_{2 m}, y_{3 m-2} y_{3 m-1}, y_{4 m-3} y_{4 m-2}, \ldots$, $y_{n-m} y_{n-m+1}, y_{n-1} y_{n}$ with $3 n, 3 n+1,3 n+2,3 n+3,3 n+4,3 n+5, \ldots$, $3 n+\left(\frac{q}{m-1}-1\right), 3 n+\left(\frac{q}{m-1}\right)$, respectively.
- For $1 \leq k \leq m-2$, label $y_{1+k} y_{2+k}, y_{m+k} y_{m+k+1}, y_{2 m+k-1} y_{2 m+k}$,
$y_{3 m+k-2} y_{3 m+k-1}, y_{4 m+k-3} y_{4 m+k-2}, \ldots, y_{n-m+k} y_{n-m+k+1}$ with $3 n+k\left(\frac{q}{m-1}\right)+1,3 n+k\left(\frac{q}{m-1}\right)+2,3 n+k\left(\frac{q}{m-1}\right)+3,3 n+k\left(\frac{q}{m-1}\right)+4$, $3 n+k\left(\frac{q}{m-1}\right)+5, \ldots, 3 n+(k+1)\left(\frac{q}{m-1}\right)$, respectively.

Case 2: $q \equiv t(\bmod m-1)$, where $t=1,2,3, \ldots, m-2$

- Label $y_{1} y_{2}, y_{m} y_{m+1}, y_{2 m-1} y_{2 m}, y_{3 m-2} y_{3 m-1}, y_{4 m-3} y_{4 m-2}, \ldots$,
$y_{q-t-m+2} y_{q-t-m+3}, y_{q-t+1} y_{q-t+2}$ with $3 n, 3 n+1,3 n+2,3 n+3,3 n+4$, $3 n+5, \ldots, 3 n+\left(\frac{q-t}{m-1}-1\right), 3 n+\left(\frac{q-t}{m-1}\right)$, respectively.
- Label $y_{\alpha} y_{\alpha+1}, y_{\alpha+1} y_{\alpha+2}, y_{\alpha+2} y_{\alpha+3}, \ldots, y_{\alpha+t-1} y_{\alpha+t}$ with $3 n+2\left(\frac{q-t}{m-1}\right)+1$, $3 n+3\left(\frac{q-t}{m-1}\right)+2,3 n+4\left(\frac{q-t}{m-1}\right)+3, \ldots, 3 n+(t+1)\left(\frac{q-t}{m-1}\right)+t$, respectively, where $\alpha=q-t+2$.
- For $1 \leq k \leq t+1$, label $y_{k+1} y_{k+2}, y_{m+k} y_{m+k+1}, y_{2 m+k-1} y_{2 m+k}$,
$y_{3 m+k-2} y_{3 m+k-1}, y_{4 m+k-3} y_{4 m+k-2}, \ldots, y_{q-t-m+k+2} y_{q-t-m+k+3}$, with $\beta_{1}^{k}$, $\beta_{1}^{k}+1, \beta_{1}^{k}+2, \beta_{1}^{k}+3, \beta_{1}^{k}+4, \ldots, \beta_{1}^{k}+\left(\frac{q-t}{m-1}-1\right)$, respectively, where $\beta_{1}^{k}=k\left(\frac{q-t}{m-1}+1\right)+3 n$.
- For $t+2 \leq k \leq m-2$, label $y_{k+1} y_{k+2}, y_{m+k} y_{m+k+1}, y_{2 m+k-1} y_{2 m+k}$, $y_{3 m+k-2} y_{3 m+k-1}, y_{4 m+k-3} y_{4 m+k-2}, \ldots, y_{q-t-m+k+2} y_{q-t-m+k+3}$, with $\beta_{2}^{k}$, $\beta_{2}^{k}+1, \beta_{2}^{k}+2, \beta_{2}^{k}+3, \beta_{2}^{k}+4, \ldots, \beta_{2}^{k}+\left(\frac{q-t}{m-1}-1\right)$, respectively, where $\beta_{2}^{k}=k\left(\frac{q-t}{m-1}\right)+3 n+t+1$.

Let us denote the labeling defined above by $g$. For $1 \leq i \leq n-m+1$, it can be checked that

$$
\begin{aligned}
& \sum_{j=i}^{i+m-1}\left[g\left(x_{j}\right)+g\left(y_{n+1-j}\right)\right]=-2+\sum_{j=i+1}^{i+m}\left[g\left(x_{j}\right)+g\left(y_{n+1-j}\right)\right] \\
& \sum_{j=i}^{i+m-2} g\left(x_{j} x_{j+1}\right)=1-m+\sum_{j=i+1}^{i+m-1} g\left(x_{j} x_{j+1}\right) \\
& \sum_{j=i}^{i+m-2} g\left(y_{n+1-j} y_{n-j}\right)=1+\sum_{j=i+1}^{i+m-1} g\left(y_{n+1-j} y_{n-j}\right)
\end{aligned}
$$

and

$$
\sum_{j=i}^{i+m-1} g\left(x_{j} y_{n+1-j}\right)=m+\sum_{j=i+1}^{i+m} g\left(x_{j} y_{n+1-j}\right)
$$

For $1 \leq i \leq n-m+1$, let $L_{m}^{(i)}$ be the subladder of $L_{n}$ with $V\left(L_{m}^{(i)}\right)=$ $\left\{x_{j}, y_{n+1-j} \mid i \leq j \leq m+i-1\right\}$ and $E\left(L_{m}^{(i)}\right)=\left\{x_{j} x_{j+1}, y_{n+1-j} y_{n-j} \mid i \leq j \leq\right.$ $m+i-2\} \cup\left\{x_{j} y_{n+1-j} \mid i \leq j \leq m+i-1\right\}$.

In a similar way as in the proof of Theorem 3 , for $1 \leq i \leq n-m$, it is easy to verify that $\sum_{i} g\left(L_{m}^{(i)}\right)=\sum g\left(L_{m}^{(i+1)}\right)$.

So, $\sum g\left(L_{m}^{(i)}\right)$ is constant for all possible values of $i$. Hence, $L_{n}$ is $L_{m^{-}}$ supermagic for every integer $3 \leq m \leq n-1$.

An example of the labeling obtained in the above proof is showed in Figure 4.

Figure 4: an $L_{3}$-supermagic labeling of $L_{9}$
