

Optical data and python processing

- The python files used to generate all of the figures in the paper are included in the folders labelled by figure name.
- All the experimental data used to create the figures is included in the respective folders.
- The data for fiber042 is in the correct folder, but was mistakenly labelled fiber041 in the filename. I decided to leave it this way because it allows easy comparison with the data files stored on the computer where the data was taken.
- SEM data is included in a separate folder, with sub-folders for each fiber.
